Enterprise Deployment & Operations

Explore the TigerGraph platform's enterprise readiness

A Graph Solution That Fits Today's Enterprise

The demands on today's modern enterprise infrastructure can pose significant challenges beyond choosing the right technology to fit the goals of any given organization. This holds true when deploying a graph database platform in your environment. TigerGraph provides the only scalable database for the enterprise delivering massively parallel computational capabilities for advanced analytics, deeper insights, and better outcomes, while meeting the most demanding deployment and operations requirements of the modern data center.

Deploying in a Complex and Growing Technology Ecosystem

Considerations for security extend to intellectual property, data protection, and ultimately a business' success. Availability and resiliency must reach the desired and stated service level agreements to meet contractual obligations of product offerings. Scalability dictates the opportunity for potential growth and additional customer acquisition without compromising the integrity of the infrastructure. Computational performance and intelligence accelerate delivery of insightful solutions for increased value.

Each of these areas, while mutually exclusive, are critical components of enterprise operations requiring best-practices and blueprints to meet the varying requirements of platform adoption. The Enterprise Deployment & Operations workshop will help ensure your TigerGraph deployment meets these, and exceeds, these business requirements.

TigerGraph Elements workshops are expert-led, interactive sessions designed to help organizations understand the possibilities graph technology offers and build innovative, powerful graph-based solutions that fit their unique business needs.

During this workshop, you'll become familiar with configuration options and integration components for rapid deployment and management in your environment. You'll explore the enterprise readiness of the TigerGraph platform, including:

- Deployment options
- Security features
- Data protection
- Data import and export
- Administration functions

About TigerGraph

TigerGraph is the world's fastest graph analytics platform designed to unleash the power of interconnected data for deeper insights and better outcomes. TigerGraph fulfills the true promise and benefits of the graph platform by tackling the toughest data challenges in real time, no matter how large or complex the dataset. TigerGraph supports applications such as IoT, AI and machine learning to make sense of ever-changing big data.
